INSTALLATION SINK

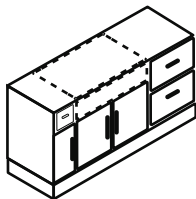

STEP 1

Proceed to remove the sink out of its box. Lift the sink and turn it upside down and place it on the counter top to trace the measurements of the cutout. It is crucial that the measurements are exact.

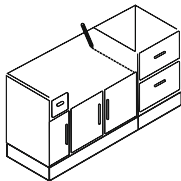

STEP 2

Cut the front of the cabinet according to the tracing. Make sure to sand down the interior wall openings of the cabinet to ensure that no damage occurs to the sink. Farmhouse sinks require a support frame because of their weight and installation method. Support types can be customized and made to accommodate different kitchen cabinets. Solid wood is recommended in creating the support frame. Due to the variety of installation methods as well as the custom nature of kitchen cabinetry, we cannot suggest a specific design for the support frame. However, the frame must be able to withstand a minimum 300 lb. weight. The below example is just a common method of installation that accommodates most kitchen cabinets. This is NOT a required nor preferred method of creating a support frame for our products, but rather an illustrative guide

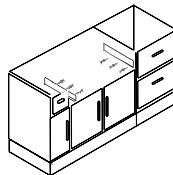

STEP 3

Having already cut the front of the cabinet according to the tracing, take a pencil and mark on the inside of the cabinet walls where the base of the sink will sit. Double check to see that the sink aligns properly with the method of installation that you have chosen (under-mount, flush mount, or top mount). Ensure to double check this and measure with a level bar

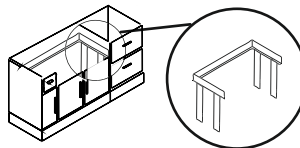

STEP 4

Next, take your 2x4's and install them on the left and right side of the interior of the kitchen cabinet. Make sure to use screws that will not drill completely through to the opposite side of the cabinet as this could cause aesthetic and structural damage

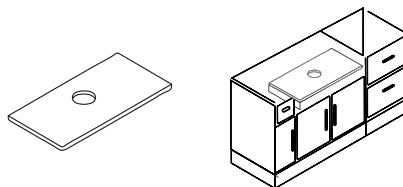

STEP 5

Create support frames below the 2x4's to ensure a rigid structure has been created. Depending on the structure and composition of the kitchen cabinet, an alternative reinforcement can be made on the back of the interior kitchen cabinet

STEP 6

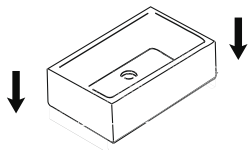

Next, cut a piece of plywood on which the farmhouse sink will be sitting on. Make sure to measure and cut any drain holes for plumbing connections

INSTALLATION SINK

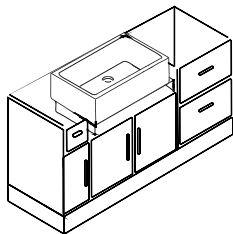

STEP 7

Test the structure by gently placing the sink onto the support. Ensure that the sink is sitting level and the created support frame can withstand the weight of the sink.

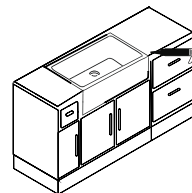

STEP 8

Having created the support frame, the next step will be to place the sink into the cutout space. Using 2 people, gently lift and carry the sink, making sure that the kitchen sink sits snug in the cutout space.

STEP 9

Having verified this, place the sink into the cutout space. Apply silicone sealant around the top of the sink and countertop. Wipe away any excess silicone. Check the surrounding space to make sure that the sink is sitting level with the cabinet.

STEP 10

If you have bought any kitchen faucets or drainage systems, this would be the time to connect and install these items as per the manufacturer's installation instructions.
